

CONFIDENTIAL INVESTMENT MEMO

Fund: Growth & Opportunity Fund III

Date: July 2025

Classification: CONFIDENTIAL — Investment Committee Distribution Only

Sector: Embedded Finance — B2B Marketplaces, Latin America

Stage Focus: Series A / Series B

Check Size Recommendation: \$15M–\$40M initial; \$80M–\$120M reserved for follow-on across 3–4 portfolio positions

Recommendation: **STRONG CONVICTION — PROCEED TO DEEP DILIGENCE ON SHORTLISTED TARGETS**

"The most valuable financial institutions of the next decade in Latin America will not look like banks. They will look like marketplaces that learned to underwrite."

I. INVESTMENT THESIS

In three lines:

Latin America's \$1.3T B2B commerce ecosystem operates on a financial infrastructure built for consumers, not businesses — creating a \$85B+ annual credit gap for SMEs transacting on digital marketplaces. Embedded finance layers (lending, payments, insurance, FX) deployed *at the point of transaction* within B2B vertical marketplaces represent a once-in-a-cycle opportunity to capture 3–8% of GMV as financial margin on commerce that is *already happening*, using proprietary transactional data as an underwriting moat that traditional banks cannot replicate. The regulatory window (Open Finance frameworks in Brazil, Colombia, and Mexico reaching operational maturity in 2024–2026) has created a 24–36 month asymmetric entry point where first-movers will build data compounding advantages that are structurally insurmountable — this is the alpha.

II. MARKET CONTEXT & OPPORTUNITY MAPPING

The Structural Gap

The core insight is not that SMEs in Latin America lack access to credit — this is well-documented and has attracted significant capital to consumer and SME neobanking. The insight is more specific and more investable:

SMEs that are already transacting on B2B digital marketplaces — purchasing inventory, selling goods, managing supply chains — are doing so without access to financial products embedded in their commercial workflow. They buy on a marketplace, then leave the marketplace to seek financing from a bank that has no visibility into their transaction history, inventory velocity, or buyer-supplier relationships. The bank underwrites blindly. The SME pays 28–65% annual interest (when approved) or, more commonly, is simply declined.

The marketplace, meanwhile, sits on a data goldmine it does not monetize: purchase frequency, order size distribution, return rates, supplier reliability scores, payment punctuality, seasonal demand patterns — precisely the data that would enable superior credit underwriting — and earns only a thin commerce commission (2–5% take rate).

This is a market design failure, not a technology gap. The technology to embed lending, insurance, and payment products into marketplace workflows exists today (BaaS providers like Dock, Prometeo, Belvo, QI Tech, and others have commoditized the infrastructure layer). What is missing is the **strategic integration layer** — the company that owns the commercial relationship AND deploys financial products within it, capturing both the commerce margin and the financial margin.

Why Now — The Convergence

Three independent vectors are converging simultaneously:

Vector	Status	Implication
B2B marketplace maturation	LATAM B2B GMV reached ~\$85–120B in 2024 across verticals (ag-inputs, construction, F&B supply, pharma, auto parts). Platforms like Frubana (now restructured), Meru,	A critical mass of digitized B2B transactions now exists upon which financial products can be layered.

Vector	Status	Implication
	Merama, and vertical-specific marketplaces have proven digital B2B adoption is real.	
Open Finance regulation	Brazil (Open Finance Phase 4 — transactional data sharing live), Mexico (Ley Fintech + secondary regulations advancing), Colombia (Decreto 1297 de 2022 — Open Finance framework operational 2024–2025).	Regulatory infrastructure now <i>enables</i> data portability and licensed non-bank financial product deployment — this did not exist 36 months ago.
BaaS infrastructure commoditization	Banking-as-a-Service providers (Dock, QI Tech, Swap Financial, Ualá BaaS, Tribal Credit infrastructure) have reduced the cost and time to deploy embedded financial products from 18 months/\$2M+ to 3–6 months/\$200K–\$500K.	The barrier to entry for the <i>technology</i> layer has collapsed. The barrier is now distribution + data — which marketplaces already own.

This convergence is temporary. Within 36 months, the most valuable B2B marketplaces will have embedded financial products and will be compounding data advantages. Late entrants will face a closed window.

TAM / SAM / SOM — Fermi Estimation

We construct the market sizing bottom-up from transactional fundamentals, not top-down from analyst reports (which do not yet segment embedded finance within B2B marketplaces specifically for LATAM).

Total Addressable Market (TAM): Embedded Finance Revenue Pool in LATAM B2B Commerce

Step 1 — LATAM B2B Commerce Base

Input	Estimate	Source / Logic
LATAM GDP (2024)	~\$5.8T	IMF, World Bank
B2B commerce as % of GDP	~45–55%	Standard ratio for middle-income economies; excludes government
Total B2B commerce volume	~\$2.6–3.2T	Midpoint: \$2.9T
Digitally intermediated B2B (marketplace, platform, digital procurement)	~4–6% of total (early but accelerating)	Analogous to China at 2015–2017 stage; India at 2019–2021
Digitized B2B GMV	~\$115–175B	Midpoint: \$145B

Step 2 — Embeddable Financial Products Revenue

Financial Product Layer	Potential Penetration (% of GMV)	Revenue Take Rate	Revenue Pool
Working capital lending (inventory financing, purchase order financing, receivables factoring)	25–35% of GMV financed	4–8% net interest margin on financed volume	\$1.5–4.0B
Embedded payments (B2B checkout, cross-border settlement, instant payouts)	60–80% of GMV processed	0.8–1.5% payment processing margin	\$0.7–2.1B

Financial Product Layer	Potential Penetration (% of GMV)	Revenue Take Rate	Revenue Pool
Embedded insurance (cargo, credit default, inventory)	10–20% of GMV insured	2–5% premium as % of insured value	\$0.3–1.8B
FX / cross-border (imports, multi-country supply chains)	15–25% of GMV involves cross-border	0.5–2.0% FX spread	\$0.1–0.9B
Total Revenue Pool			\$2.6–8.8B

TAM = ~\$5.5B (midpoint of revenue pool estimate, annual)

Serviceable Addressable Market (SAM): Focus Geographies & Verticals

We narrow to the three markets with regulatory readiness + marketplace density + fund thesis alignment:

Filter	Reduction Factor	Logic
Geography: Brazil, Mexico, Colombia only	~65% of LATAM digitized B2B GMV	These three markets represent ~70% of LATAM GDP; regulatory frameworks most advanced
Verticals with marketplace concentration	~50% of filtered GMV (ag-inputs, F&B supply chain, construction materials, auto parts, pharma)	These verticals have proven marketplace models and high transaction frequency (critical for data-driven underwriting)
Stage-appropriate (Series A/B companies can realistically capture)	~40% of vertical-filtered market within 5-year horizon	Excludes segments dominated by bank-led solutions or Tier-1 tech incumbents (MercadoLibre Crédito, etc.)

SAM = ~\$5.5B × 0.65 × 0.50 × 0.40 ≈ \$715M (annual revenue pool)

Serviceable Obtainable Market (SOM): Portfolio Company Capture — 5-Year Horizon

Assuming 3–4 portfolio companies, each becoming category leader in 1–2 verticals within 1–2 geographies:

Assumption	Value
Number of portfolio companies	3–4
Average market share per company in served vertical/geo (Year 5)	12–20%
Combined portfolio capture of SAM	~15% blended
SOM (Year 5 Revenue — Portfolio Level)	~\$105–115M

At a 12–18x revenue multiple (appropriate for high-growth fintech infrastructure with embedded distribution), this implies a **portfolio gross value of \$1.3–2.1B** on a deployed capital base of \$80–120M — a **10–18x gross MOIC** at the upper bound, assuming standard dilution and follow-on economics.

This is a fund-defining opportunity.

Market Sizing Summary

text

MARKET OPPORTUNITY	
TAM: ~\$5.5B	
Embedded finance revenue pool across all LATAM digitized B2B commerce	

▼	
SAM: ~\$715M	
Brazil + Mexico + Colombia; target verticals;	
stage-appropriate segments	
▼	
SOM: ~\$105-115M	
Projected 5-year portfolio revenue capture	
(3-4 portfolio companies, 12-20% share each)	
▼	
Implied Portfolio Value: \$1.3-2.1B	
(12-18x revenue multiple)	
Gross MOIC: 10-18x on \$80-120M deployed	

III. REGULATORY MOAT ANALYSIS

Open Finance as Structural Enabler — Who Benefits: Incumbents or Disruptors?

The regulatory landscape across the three target markets is, for the first time, **structurally favorable to disruptors over incumbents** — but this advantage is time-bound and conditional.

Brazil has the most advanced Open Finance framework globally. Phase 4 (transactional data sharing across banking, insurance, investment, and pension products) became operational in 2023–2024, with the Central Bank (BCB) mandating participation from all regulated institutions with more than 500,000 clients. Critically, the framework is **asymmetric by design**: large banks are *obligated* to share data upon

customer consent, while fintechs and smaller institutions can *request* data without equivalent disclosure obligations. This creates a regulatory arbitrage — a B2B marketplace with a financial license (SCD or SEP in Brazil's framework) can pull transactional banking data from Itaú, Bradesco, or Banco do Brasil to enrich its underwriting models, while those banks cannot access the marketplace's proprietary commercial data (purchase patterns, supplier ratings, inventory turnover). The information advantage is **structurally one-directional** — favoring the entity that controls the commercial relationship.

Colombia's Decreto 1297 de 2022 and subsequent Superintendencia Financiera circulars established Latin America's first explicit Open Finance regulatory framework (distinct from Open Banking), encompassing not just banking data but insurance, pension, and securities data. The operational rollout (2024–2025) is creating a similar asymmetry: regulated entities must expose APIs; licensed fintechs can consume them. Colombia's additional advantage is its **regulatory sandbox framework** (supervised by SFC), which allows embedded finance models to operate under temporary licenses while building compliance infrastructure — a meaningful de-risking mechanism for Series A/B companies.

Mexico's Ley Fintech (2018) was pioneering but implementation has been slow. Secondary regulations on Open Finance APIs were delayed repeatedly, with meaningful operational readiness not expected until 2025–2026. However, Mexico's SOFOM (Sociedad Financiera de Objeto Múltiple) licensing structure provides a relatively accessible pathway for non-bank entities to originate credit — and B2B marketplaces have already begun using SOFOM structures to deploy embedded lending without full banking licenses.

The critical regulatory insight for our thesis: Open Finance regulation is creating a **temporary window of asymmetric data access**. For the next 24–36 months, entities that combine (a) proprietary commercial data from marketplace operations with (b) regulated financial data accessed via Open Finance APIs will have an underwriting information advantage that is both **legally protected** (banks cannot access commercial data without bilateral agreements) and **compounding** (each transaction enriches the model). Once large banks or MercadoLibre-scale platforms build equivalent embedded capabilities, this window narrows. First-movers who achieve data network effects during this window will have built a moat that regulation itself helped dig.

The regulatory posture is clear: **the state is subsidizing disruption**. We should deploy capital while this subsidy is active.

IV. COMPETITIVE LANDSCAPE

Who Is Playing — And Where the White Space Exists

Player Category	Examples	Embedded Finance Approach	Vulnerability
Horizontal B2B Marketplaces	MercadoLibre (Mercado Crédito), Amazon Business	Platform-level lending at scale; data-rich but generalist	Generalist underwriting; not optimized for vertical-specific risk (e.g., agricultural seasonality, construction project cycles)
Vertical B2B Marketplaces (no embedded finance)	Frubana (F&B, restructured), Meru (construction), ByPrice, Ubícalo	Own commercial relationship but monetize only on commerce take rate	Prime acquisition/investment targets. They have distribution + data but no financial product layer. This is our entry point.
B2B Fintechs (lending-first)	Tribal Credit, Konfío, a]55, Cora	Financial product expertise but dependent on third-party distribution or direct SME acquisition	High CAC (\$150–\$400/SME); no proprietary commercial data; underwriting relies on banking/bureau data, not transactional
BaaS Infrastructure	Dock, QI Tech, Belvo, Prometeo, Swap	Enable embedded finance but do not own distribution or end-customer	Infrastructure commoditization risk; value capture is thin (SaaS/API fees vs. financial margin)

Player Category	Examples	Embedded Finance Approach	Vulnerability
Traditional Banks with SME Digital Units	BBVA Spark, Bancolombia Negocios, Itaú Empresas	Large balance sheets; regulatory licenses; brand trust	Slow product cycles (12–18 months); no access to marketplace commercial data; cultural inability to operate at marketplace speed

The White Space

The highest-conviction opportunity sits at the intersection of **vertical B2B marketplace** (owns commercial relationship + proprietary transactional data) and **embedded financial products** (captures financial margin on existing transaction flow). This intersection is currently occupied by almost no one in LATAM at scale.

Ideal target company profile:

- Vertical B2B marketplace with \$50M–\$500M GMV
- Operating in Brazil, Mexico, or Colombia
- 5,000–50,000 active SME buyers
- Transaction data history of 12+ months
- No or nascent embedded finance (pre-revenue on financial products)
- Founder team with fintech literacy or willingness to hire/partner
- Series A or early Series B stage

V. RISKS & MITIGATIONS

We identify three major risk vectors, each with structured mitigants:

Risk 1: Credit Risk — Portfolio Default in an Untested Underwriting Model

Severity: HIGH
Probability: MODERATE-HIGH

The Risk:

Embedded lending within B2B marketplaces will rely on proprietary transactional data for underwriting — purchase frequency, order sizes, payment history, supplier relationships. This data has **never been stress-tested as a credit signal across a full economic cycle in LATAM**. Models trained on 2021–2024 data (post-pandemic recovery, commodity boom) may fail catastrophically in a recession. SME default rates in LATAM have historically spiked to 8–15% in downturns (vs. 2–5% in growth periods). If embedded lending portfolios experience defaults at the upper end of this range, portfolio companies burn cash rapidly and unit economics collapse.

Additionally, there is a **correlation risk** specific to embedded models: because the marketplace *is* the distribution channel, a downturn that reduces marketplace GMV simultaneously (a) shrinks the lending opportunity and (b) increases default probability among borrowers whose revenue depends on that same marketplace. The loan book and the distribution channel are correlated to the same macro variable.

Mitigants:

Mitigant	Mechanism
Conservative initial LTV ratios	Cap initial credit lines at 30–40% of trailing 90-day purchase volume (not annualized). This limits exposure to a fraction of demonstrated commercial activity.
Structural repayment integration	Loan repayment is deducted automatically from marketplace transaction proceeds before settlement to the borrower. This creates a first-lien-equivalent cash flow capture — the borrower cannot divert payment without exiting the marketplace (and thus losing their commercial channel). Default requires the borrower to simultaneously abandon their primary sales/procurement platform.
Short duration bias	Focus on working capital products with 30–90 day tenors, not term loans. Short duration limits loss-given-default and enables rapid portfolio

Mitigant	Mechanism
	adjustment. A 60-day receivables factoring product that goes bad costs the book 60 days of exposure, not 36 months.
Portfolio insurance layer	Partner with embedded insurance providers (Clupp, Sura Digital, 88i) to insure 20–40% of the credit book against default — transferring tail risk off the balance sheet.
Gradual ramp with vintage analysis	Deploy credit at controlled velocity; analyze each monthly vintage's 30/60/90 DPD (days past due) performance before expanding. Do not scale lending ahead of data.

Residual Risk Assessment: MODERATE. Mitigants reduce probability of catastrophic loss but do not eliminate credit risk. We underwrite to a base case of 4–6% annual default rate and a stress case of 10–12%. Portfolio companies must demonstrate unit-economic resilience at the stress case level before we commit follow-on capital.

Risk 2: Regulatory Risk — License Revocation, Framework Change, or Compliance Burden

Severity: HIGH

Probability: LOW-MODERATE

The Risk:

Embedded finance in LATAM operates across a patchwork of licensing frameworks that are evolving rapidly. Key risks include:

- **Licensing withdrawal or tightening:** Regulators (BCB, CNBV, SFC) could impose new capital requirements, operational mandates, or licensing conditions that dramatically increase the cost of operating embedded financial products. Brazil's BCB has already shown willingness to intervene aggressively (PIX regulation, credit card interchange caps).
- **Open Finance rollback or stalling:** Mexico's repeated delays in Open Finance secondary regulation demonstrate that political transitions (new administrations, legislative priorities) can freeze or reverse regulatory progress.

- **Cross-border complexity:** A portfolio company operating in Brazil + Colombia faces two distinct regulatory regimes, two licensing requirements, and two compliance frameworks. Regulatory arbitrage is possible but so is regulatory conflict.
- **Consumer/SME protection backlash:** If embedded lending models produce high default rates or are perceived as predatory (high implicit APRs on short-term products), regulators could impose rate caps, mandatory cooling-off periods, or enhanced disclosure requirements that destroy unit economics.

Mitigants:

Mitigant	Mechanism
License-first strategy	Require portfolio companies to obtain (or partner for) full regulatory licenses <i>before</i> scaling financial products — not after. In Brazil: SCD (Sociedade de Crédito Direto) or partnership with licensed SCDs. In Colombia: utilize SFC sandbox or SEDPE license. In Mexico: SOFOM registration or Ley Fintech ITF/IFP license. Regulatory compliance as Day 1 requirement, not retrofit.
Regulatory affairs investment	Fund dedicated regulatory affairs capability within each portfolio company (hire or retain). Require quarterly regulatory horizon-scanning reports to the board. Early detection of regulatory shifts enables proactive adaptation.
Geographic diversification within portfolio	Ensure portfolio exposure is distributed across at least 2 of 3 target markets. A regulatory shock in one market does not impair the entire portfolio thesis.
Rate and transparency discipline	Establish portfolio-level guidelines on maximum effective APR (recommend cap at 3–4x country risk-free rate), mandatory APR disclosure in plain language, and voluntary adherence to emerging responsible lending standards. Pre-empt regulatory intervention by self-regulating.

Residual Risk Assessment: LOW-MODERATE. LATAM regulators are broadly *encouraging* financial inclusion via fintech — the political incentive is aligned with our thesis. The primary risk is not hostile regulation but *incompetent* regulation (poorly designed rules that create unintended compliance burdens). This is manageable with adequate legal investment.

Risk 3: Adoption Risk — SME Willingness to Use Embedded Financial Products

Severity: MODERATE

Probability: MODERATE

The Risk:

The thesis assumes that SMEs transacting on B2B marketplaces will adopt embedded financial products offered within the marketplace. This assumption may fail for several reasons:

- **Trust deficit:** LATAM SMEs have historically low trust in non-bank financial providers. A marketplace that suddenly offers credit may be perceived with suspicion ("Why do they want to lend to me? What's the catch?").
- **Behavioral inertia:** SMEs with existing banking relationships (even suboptimal ones) may not switch to marketplace-embedded products due to familiarity bias, relationship loyalty with bank officers, or simple lack of awareness.
- **Digital literacy gaps:** In certain verticals (agriculture, construction), SME operators may lack the digital fluency to engage with embedded financial products within a marketplace UI — even if the products are well-designed.
- **Data consent resistance:** Open Finance requires explicit customer consent for data sharing. SMEs may refuse consent due to privacy concerns, tax exposure fears (a major factor in LATAM's informal economies), or lack of understanding of what consent entails.

Mitigants:

Mitigant	Mechanism
"Show, don't sell" activation	Do not market financial products as financial products. Instead, embed them invisibly into the commercial workflow. Example: at checkout, display "Pay in 3 installments — no interest for 30 days" as a

Mitigant	Mechanism
	payment option, not as a "loan application." The SME experiences a purchasing convenience, not a financial product. Activation rates for invisible embedding are 3–5x higher than for standalone financial product marketing (Source: Shopify Capital data, Unit Economics benchmark reports).
Graduated exposure model	Start with zero-risk products (embedded payments, instant settlement) before introducing credit products. Build trust and behavioral habit with low-stakes financial interactions. Then introduce working capital products to SMEs with 6+ months of transaction history on the platform.
Sales force integration	In verticals with field sales teams (ag-inputs, construction materials), train field reps to explain and activate embedded financial products in person. The human touchpoint bridges the digital literacy gap and leverages existing trust relationships between the SME and the marketplace's commercial representative.
Tax-neutral product design	Structure financial products to avoid triggering incremental tax visibility for SMEs (e.g., factoring structures that do not create new taxable events; payment terms that align with existing invoicing practices). Acknowledge the informal economy reality without enabling tax evasion — a delicate but essential design consideration.

Residual Risk Assessment: MODERATE. Adoption risk is real but addressable through product design and go-to-market strategy. The strongest mitigant is the structural one: if the financial product is embedded seamlessly into a commercial action the SME is *already performing* (buying inventory), adoption becomes a UX problem, not a behavioral change problem. UX problems are solvable.

Risk Summary Matrix

Risk	Severity	Probability	Residual (Post-Mitigation)	Fund Impact if Realized
Credit / Default	HIGH	MOD-HIGH	MODERATE	Portfolio company cash burn; write-down of 1–2 positions
Regulatory	HIGH	LOW-MOD	LOW-MOD	Licensing delays; compliance cost increase; potential market exit
Adoption	MODERATE	MODERATE	MODERATE	Slower ramp; extended time-to-revenue; higher CAC than modeled

Portfolio-Level Risk Management:

Diversification across 3–4 companies, 2–3 geographies, and 2–3 verticals provides structural resilience. Even in a scenario where 1 portfolio company fails (credit blowup or regulatory issue) and 1 underperforms (adoption lag), the remaining 1–2 winners — in a power-law distribution consistent with VC — can return the fund on this thesis alone.

VI. INVESTMENT STRUCTURE & DEPLOYMENT RECOMMENDATION

Proposed Capital Allocation

Tranche	Timing	Amount	Purpose
Initial positions (3–4 companies)	Q3 2025 – Q2 2026	\$50–65M	Series A/B lead or co-lead; board seat; active governance
Follow-on reserve	Q3 2026 – Q4 2028	\$55–70M	Double down on winners (Series B/C); pro-rata + super pro-rata
Total deployment on thesis	36 months	\$105–135M	

Target Return Profile

Scenario	Probability	Portfolio Gross Value	Gross MOIC	Net IRR (est.)
Bull case (2 category winners, 1 solid performer, 1 write-off)	25%	\$1.8–2.4B	14–18x	65–85%
Base case (1 category winner, 2 moderate performers, 1 write-off)	45%	\$800M–1.3B	6–10x	40–55%
Bear case (0 breakout winners, 2 moderate, 2 underperform/fail)	25%	\$250–500M	2–4x	15–25%
Catastrophic (systemic credit event + regulatory shock)	5%	\$50–150M	0.4–1.2x	Negative

Expected Value (probability-weighted): 7–11x gross MOIC. This exceeds our fund-level return threshold of 3–4x gross and represents a **top-decile opportunity within our current pipeline.**

VII. PREDICTION

The Audacious Bet: LATAM B2B Finance in 2030

We close this memo not with a summary, but with a conviction statement — a prediction that, if correct, validates a generational deployment of capital into this thesis:

By 2030, the three largest *de facto* SME lenders in Latin America will not be banks.

They will be B2B vertical marketplaces — in food supply chain, agricultural inputs, and construction materials — that embedded financial products into their commercial platforms between 2025 and 2027.

These companies will each process \$2–8B in annual GMV, originate \$500M–\$2B in annual credit, and maintain default rates 40–60% below traditional bank SME portfolios — because they will underwrite not on financial statements and bureau

scores, but on **real-time commercial behavior**: what the borrower buys, from whom, how often, at what margin, with what seasonality, and with what reliability.

They will hold banking licenses but will not look like banks. They will not have branches. They will not have relationship managers. They will have **algorithms that have observed ten million transactions** and learned what a healthy business looks like *before the business itself knows*.

The traditional banking sector will respond — slowly, through partnerships, acquisitions, and imitation. By then, the data moat will be structural. The marketplace-lenders will have 5+ years of proprietary transactional credit data that no bank can replicate without building its own marketplace. No bank will build its own marketplace.

One or two of these companies will be worth \$5–15B. They will be the Nubanks of B2B — platform companies that used financial services not as their product, but as their **margin architecture** on top of commerce. They will be studied in business schools and cited in regulatory frameworks.

And the fund that backed them at Series A — when they were still "just a marketplace" selling construction materials to hardware stores in São Paulo or agricultural inputs to smallholders in Boyacá — will have captured one of the most asymmetric returns in LATAM venture history.

The window is open. The thesis is clear. The data supports conviction.

We recommend proceeding.

VIII. IMMEDIATE NEXT STEPS

Action	Owner	Timeline
Finalize target shortlist (8–12 companies across BR/MX/CO)	Deal Team + LATAM Scouts	4 weeks
Initiate founder conversations (top 5 priority targets)	Lead Partner + Analyst	6 weeks

Action	Owner	Timeline
Commission independent market sizing validation (McKinsey/Bain engagement or internal deep-dive)	Research Team	6 weeks
Regulatory landscape deep-dive (external counsel: Pinheiro Neto BR, Galicia MX, Brigard Urrutia CO)	Legal/Compliance	8 weeks
Credit risk modeling workshop (stress-test embedded lending unit economics at portfolio level)	Risk Team + Operating Partners	8 weeks
Investment Committee — Full thesis presentation with target term sheets	Lead Partner	10–12 weeks

Prepared for Internal Distribution Only

Investment Committee Review Requested: [DATE]

Lead Analyst: [REDACTED]

Sponsoring Partner: [REDACTED]

"In Latin America, every decade produces one financial infrastructure shift that creates \$50B+ in enterprise value. The 2010s were consumer digital payments (Nubank, MercadoLibre Fintech, dLocal). The 2020s will be embedded B2B finance. The question is not whether to invest. The question is whether we invest early enough to matter."
